

Element Management System Architecture without using SNMP

Inventors: **Vijay Phagura and Anita Phagura**

Abstract

The Element Management System (EMS) software which manages hardware and its component software have to always use Simple Network Management Protocol (SNMP) to manage the components, conventionally. This limits the capability of an EMS and presents additional problems to manage a component. This solution presented here eliminates the use of SNMP, by illustrating more efficient modes of control. The solution also segregates data into real-time data and static data.
